Tickets in. Reviewed work out.

A working session · Sanvio Labs

Today ends with five things you can point at.

Not a demo you watched.

Things you did, in your own clone.

Five finish lines.

01 **Your clone**
the setup check passes, and you're its owner

02 **Your knowledge**
it answers from your docs and names the page

03 **Your skill**
one procedure you already run, vetted before it comes in

04 **Your first motion**
one real ticket became a pull request a person merged

05 **Your first gate**
one check that exists because the agent got it wrong today

01

Why a factory

The model is the engine. The factory holds it to your rules.

START HERE

What a harness is

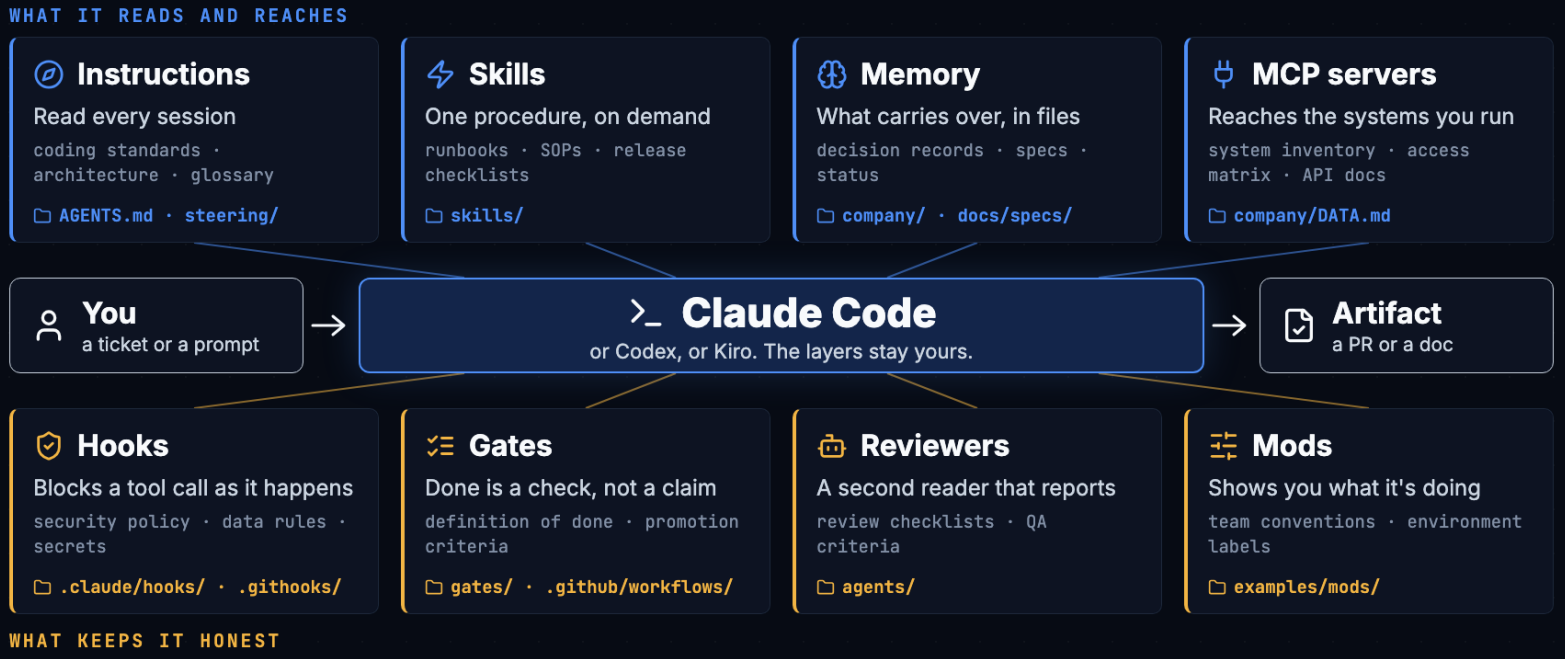

Everything around the model: what it reads, the steps it follows, and the checks that stop it.

WHERE YOUR COMPANY GOES IN

Anatomy of a harness

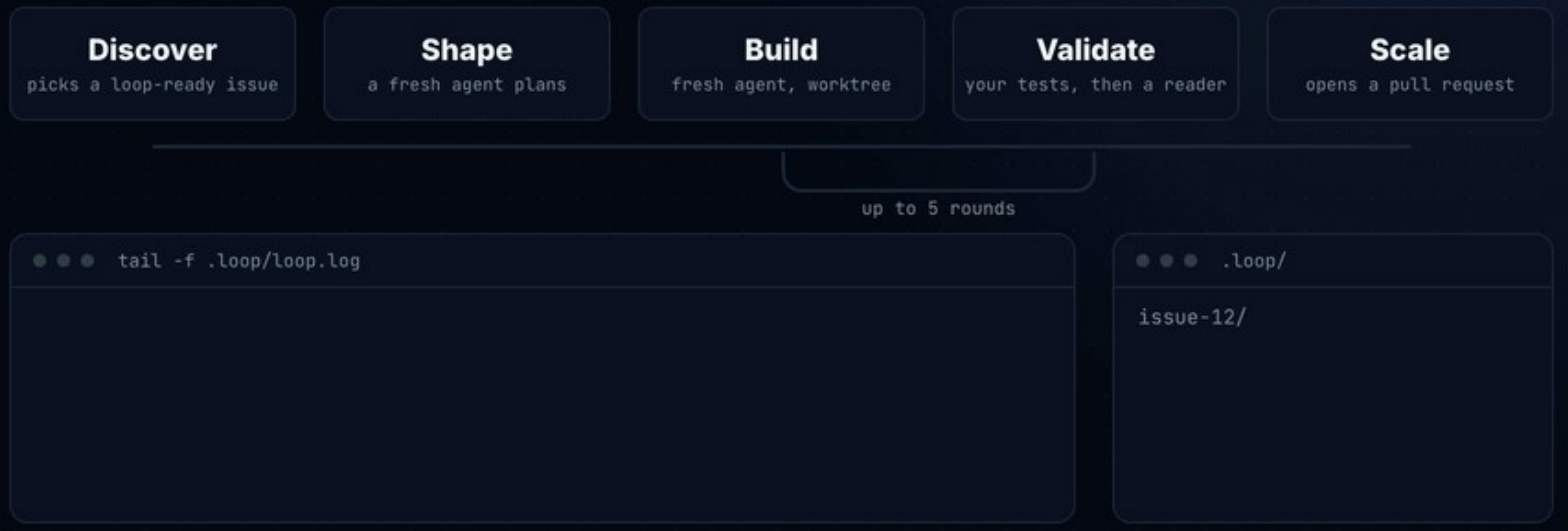

Claude Code does the work. Your documents decide how. Folders: the starter repo.

THE LOOP

One issue, start to finish

scripts/loop.py takes a ready issue to a pull request, one step at a time. You merge.

You hold the levers.

Each step waits for sign-off, or runs on its own.

Most teams start gated and release steps as they prove out.

02

Your own clone

Your account. Your environment. You own it.

Three lines, and don't skip the middle one.

zsh · my-factory

```
$ git clone https://github.com/SanvioLabs/sanvio-factory my-factory
$ git config core.hooksPath .githooks
$ python3 scripts/check_setup.py
Run it until every line passes or names a fix
```

It runs on your account.

Nothing of yours passes through our tooling.

A business or team plan for anything near your code or data.

03

Connect your knowledge

Before it builds anything, it should know how you work.

One source, connected the safe way.

01 **One named space**
a single wiki space or folder, not the whole wiki

02 **Read-only, through your connector**
the wiki or drive tool you already use

03 **One row in `company/DATA.md`**
where it lives, how it's reached, whether it's cleared

04 **The test**
ask it a question and it names the page

Ask it something only your company would know.

If it can't name the page, it guessed.

What never goes in.

01 **Customer or end-user records**

02 **Credentials, tokens, keys**
reference them by name, never paste them

03 **Anything regulated, until the contract says it can**

04 **Correspondence with third parties**

04

Skills

One procedure you already run, the same way every time.

A skill has four parts.

01 **A name**

02 **A description that says when to use it**

03 **Numbered steps**

04 **A defined output**

if you can't say what it is, it isn't a skill yet

Borrowed skills get reviewed first.

01 **Quarantine**
it reads every file without running any of it

02 **Covered**
you already have this

03 **Gap**
adopt it, in your own conventions

04 **Conflict**
it fights a rule you have

Ten minutes.

Pick the ticket you'll run next.

05

Your first motion

One real ticket, end to end.

From ticket to merge.

01 **Write it**
`/stelliad:create-ticket`

02 **Grade it**
`/stelliad:review-ticket` says READY or why not

03 **Label it `loop-ready`**
that label is the Shape gate

04 **The loop plans, builds, tests and reviews**

05 **It opens a pull request. A person merges it.**

The loop opens the pull request. A person merges it

tmux · loop

```
$  python3 scripts/loop.py run --issue 61
✓  SHAPE plan written
✓  BUILD round 1: 3 files
✓  VALIDATE tests passed, review PASS
✓  SCALE pull request #62 opened
1 min 47 s. Then a person merged it.
```

Read the pull request like a reviewer would.

Then merge it, or send it back.

06

Your first gate

Added where it went wrong, not where you guess.

LOOP 4: NEW MATERIAL

Mistake to rule

A correction you only said out loud hasn't happened. Write it into the file that governs it.

session 1

AGENTS.md

```
## Rules
- Every input comes from a named source.
- Leave no placeholder in finished work.
```

A rule is context. A hook is enforcement.

zsh · my-factory

```
$  git add proposals/juniper-bakery.md
$  git commit -m "Juniper Bakery proposal"
BLOCKED  Designer: rate 125 is not the rate card's 150
Commit blocked. Fix what's named above.
```

A check that doesn't block is decoration.

07

What comes next

Today was the first five steps.

The path from here.

01 **Today, steps 1 to 5**
your clone, your knowledge, skills, a first motion, a gate

02 **Step 6, specs**
feature-level work, built from your own notes

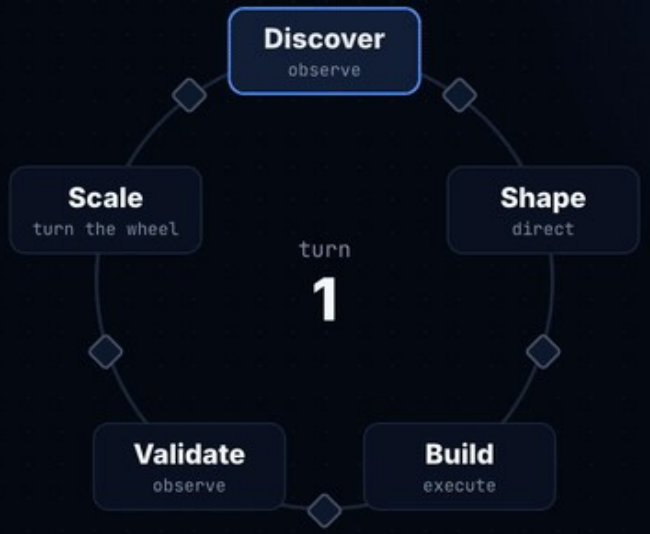

03 **Step 7, your team**
one person first, then everyone, improving each sprint

04 **Step 8, your own loop**
tickets in, built, tested, reviewed, a person at the end

THE MAIN LOOP

The flywheel

Each turn ends at a gate, and what it learned starts the next one. The four loops turn inside it.

THE GATE ASKS

Homework both ways.

One thing you do. One thing we do.

And the next session goes on the calendar before we hang up.

Take it home.
